

MySQL Vs MySQLi In Php

PDO vs. MySQLi: Which Should You Use?

If you are using MySQL or MariaDB in PHP, then you have the ability to choose either MySQLi or PDO. The former is simply an improved version with procedural and OOP support and added prepared statements, while the latter is an abstraction layer that allows you to use a unified API for all 12 database drivers it supports. Though it should be mentioned that MySQL is undoubtedly the most popular database to use in the PHP world anyway.

MySQL, on the other hand, is an open source relational database management system (RDBMS). MySQL is a popular choice of database for use in web applications. PHP is a server-side scripting language that has its main implementation in web development. However, it can be used as a general-purpose programming language.

MySQLi stands for MySQL improved. It's an object-oriented interface to the MySQL bindings which makes things easier to use. It also offers support for prepared statements (which are very useful). If you're on PHP 5 use MySQLi.
